

- Risk-Adaptive DLP:** Are controls becoming more targeted and adaptive as user behavior, data sensitivity, and risk change?
- AI Risk Management:** Does the customer have visibility into AI activity, Shadow AI, agentic workflows, and emerging AI governance needs?
- Behavior Analytics + Telemetry:** Is endpoint/activity coverage stable enough for trusted investigations and executive reporting?
- i³ Services:** Are investigative and intelligence resources being used where internal teams need extra depth or speed?

4. Playbooks

Playbook	When / how to use it
Executive sponsor reset	Use after sponsor departure or re-org. Reconfirm desired outcomes, risk priorities, decision process, and renewal proof points.
Adoption recovery	Use when coverage or workflow usage slips. Establish baseline, identify blocker, define a 30-day milestone, and measure recovery.
AI risk expansion	Use when AI policy, Shadow AI, or agent oversight appears. Convert concern into discovery, success criteria, and a scoped evaluation.
Renewal risk	Start early. Pair health signals with executive value evidence and close gaps before pricing or procurement dominates.
Critical support escalation	Create a clear owner, timeline, executive communication cadence, and post-resolution trust-recovery plan.
Leaver / high-risk user program	Map policy, stakeholder workflow, escalation criteria, and measurable prevention or investigation outcome.

5. Onboarding: Day 0 to Value

Window	Milestone	CSM objective
0-7 days	Outcome alignment	Confirm use case, success criteria, executive sponsor, admin owners, security/privacy constraints.
7-21 days	Deployment health	Establish telemetry/coverage baseline, validate roles and integrations, remove technical blockers.
21-45 days	Workflow activation	Operationalize investigations, policy/risk workflows, alerts, reporting, and stakeholder cadence.
45-75 days	Measured value	Document time saved, risk surfaced, response improved, false-positive reduction, or control maturity.
75-90 days	Executive proof	Package success story, next-quarter objectives, unresolved gaps, and expansion opportunities.

6. QBR / EBR Storyline

- 1. Why we started:** Restate the customer's business/security objective.
- 2. What changed:** Show deployment, adoption, and program maturity since the prior review.
- 3. What improved:** Use measurable security and operational outcomes instead of feature counts.
- 4. What is at risk:** Surface gaps clearly: ownership, coverage, workflow maturity, support, or policy.
- 5. What happens next:** Agree on 2-4 milestones, owners, dates, and the next executive proof point.

7. Signal-to-Action Rules

Customer signal	Recommended next action
Executive sponsor changed	Executive reset + stakeholder map
Coverage / telemetry dropped	Technical recovery milestone + escalation
Usage stable but outcome unclear	Value evidence workshop
AI governance concern appears	AI risk discovery + scoped evaluation
Renewal < 120 days + weak adoption	Renewal recovery plan immediately
High support burden	Executive comms + post-resolution trust plan
Strong outcome evidence	QBR story + expansion discovery

Interview Demonstration Flow

60-second path: Open Command Center → select one at-risk account → explain the signal → show the recommended playbook → connect the action to a measurable customer outcome → show how that same evidence supports renewal confidence.

What the demo proves: You are not treating Customer Success as reactive account coverage. You are operating a repeatable system that links signals, ownership, action, measurable value, and commercial outcomes.

This guide and CRM are independent concept demonstrations built from public product positioning and synthetic customer data. They are not official company materials.
